

Embedded System Certification Course for GosNIIAS

Case Study 1

marinvent CORPORATION

Issued: **December 22, 2011**

BACKGROUND

This Case Study applies the concepts learned in sections 1.1 – 1.4 to a hypothetical certification situation. An important consideration is that the information provided in the scenario is not enough for you to perform your task, so you must solicit more facts. This is a valuable learning point that you will encounter often in certification, so try to explore different options, as you analyse the situation.

SCENARIO

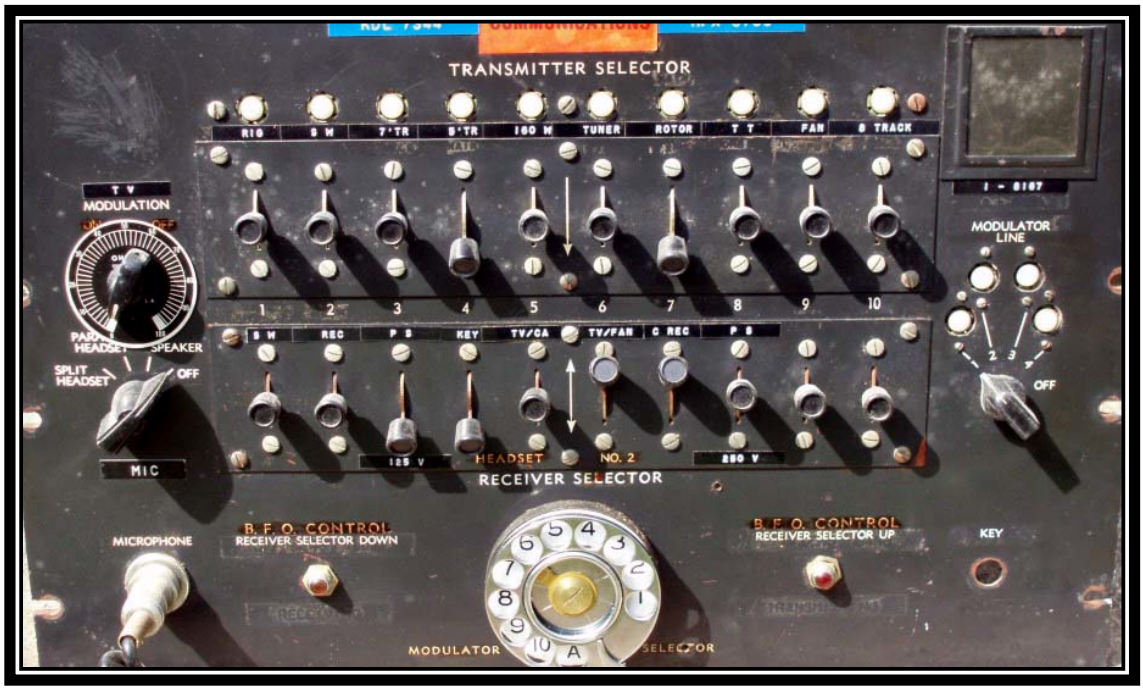

You are acting as a Transport Canada Design Approval Representative **(DAR)** in the Systems specialty. This authorizes you to make certain **findings of compliance** against the airworthiness standards.

Your first customer arrives with his latest invention an advanced GPS-based navigation system that incorporates his patented Linear Optimization Subroutine Technology algorithms (Figure 1).

Your customer wants you to *"...certify my improved system in North America to navigate airplanes."*

TASKS

1) What questions should you ask your new customer? These will be raised and discussed during the first half of the session, and recorded in point form by each team before performing the next task.
2) Identify the Regulations, Standards, Guidance Materials, and Industry Documents that might apply to this certification. (Hint: start somewhere, and use cross-references to see where they lead). **Record the Title, Number, Effective date, and URLs for each of your sources on a spreadsheet or text document.**
